Subject:

Rush search request for 09/674237

Please search in commercial database, issued patent files, and PGPUB:

1) A nucleotide sequence encoding SEQ ID NO:3, with size limitation of the sequences in the database 100 nucleotides or less.

2) SEQ ID NO:1, with size limitation of the sequences in the database 100 nucleotides or less. 3) SEQ ID NO:2, with size limitation of the sequences in the database 100 nucleotides or less.

Thank you. MINH TAM DAVIS

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oligonucleotide array, useful for measuring ortholog gene-expression distribution, comprising number of oligonucleotides derived from ortholog gene of different organism immobilized on support.

Disclosure; Page 16; 56pp; Japanese.

The invention relates to a novel oligonucleotide array comprising a number of oligonucleotides derived from an orthologue gene of a different organism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different organisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the orthologue gene of the organism A and organism B. The sequence match degree of the organism species A and the organism species B is less than 70%. The sequence homology of the genes other than the orthologue gene of 

·

```
the organism species A and the organism species B is the level-of-
statistical-significance value, calculated using the homology searching
algorithm: basic local alignment search tool (BLAST) and the value is 0.1

or more. The found value or the calculated value of the melting-
temperature of the variant genes other than the orthologue gene of the

organism species A and the organism species B is 20 degrees C or more.

The oligonucleotide array is useful for measuring expression distribution
of the orthologue gene in different organisms. The method is useful for
comparing expression change of the orthologue gene with respect to
the orthologue gene in different organisms. The oligonucleotide array has
the ability to perform a measurement of gene-expression distribution of
two or more types of organism simultaneously. The oligonucleotide array in
improves reliability of measurement. This polynucleotide sequence
represents a probe of a rat gene for comparison against a human gene used
in the oligonucleotide array of the invention.
                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse spliced transcript detection oligonucleotide SEQ ID NO:27224.

```

The present invention describes oligomucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several

Example 1; SEQ ID NO 27224; 47pp; English.

```
coligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised mini transcriptomes. The libraries may also be used as specialised mini transcriptomes. The libraries of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue or pathology-specific genes such as those genes only expressed in specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from trans, invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4117

```
CC messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or cannitatively characterising the corresponding transcriptom, and in detecting RNA transcripts and splice variants of human or animal conscriptomes. The libraries may also be used as specialised minical libraries to detect transcripts of a sub-transcriptome under a particular collibraries to detect transcripts of a sub-transcriptome under a particular collibraries to detect transcripts of a sub-transcriptome under a particular collogical or pathological state, and so allowing the detection of tissue condition is particular developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular collogical collogical state, and so allowing from a particular collogical state, and so allowing from a particular collogical state, and so allowing from a particular collogical state, which are used in the exemplification of the printed specific particular collogical state, and so allowing from the content of the printed specification, but was obtained in electronic format and so allowing in the exemplification of the print of the coligion of the coligion o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries may also be used as specialised minicatering the transcripts and splice variants of human or animal transcripts and splice variants of human or animal transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific genes; and to detect RNA transcriptome of a pathent subscriptome of a pathen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

WPI; 2003-248169/24.

New RNA comprising double stranded RNA and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, useful as reverse

WPI; 2003-248169/24

```
inhibition of expression of a target gene, where (1) comprises double granded RNA of 15-40 nucleotides in length and a 3 or 5 overhang having a length of 0-nucleotide to 5-nucleotides on each strand, where (1) comprises double conclectide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (1); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed different double-stranded RNAs; (3) an array-based method of assessing a different double-stranded RNAs; (3) an array-based method of assessing a validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA for inhibiting expression of a target gene on a condition; inhibiting expression of a target gene on a cill; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene on a cill; inhibiting expression of a target gene comprising any of 311 20-78 nucleotide sequences (see ADC16276 to ADC16586). (1) has cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene. They are insering for pression.
genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene.
                                                                                                                                                                                              present invention describes an RNA (I) used for the interference or

The present invention describes an RNA (1) used for the interference or inhibition of expression of a target gene, where (1) comprises double stranded RNA of 15-40 nucleotides in length and a 3 or 5' overhang having a length of 0-nucleotides in length and a 3' or 5' overhang continued the formal control of a manage of the double stranded RNA is substantially identical to a portion of a man or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (1); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed different double-stranded RNA; (3) an array-based method of assessing a phenotypic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1445 AGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGC 1504
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inhibiting expression of a target gene comprising any of 311 20-78 nucleotide sequences (see ADC16276 to ADC16586). (1) has cytostatic activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene. They are useful for treating proliferative diseases,
                                                   New RNA comprising double stranded RNA and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Membrane-associated protein, antiviral, antibacterial, antiparasitic, immunomodulatory, anticatory, anticatory, antialitic, antidiabetic, neuroprotective, chimeric receptor, infection, inflammatory disorder, autoimmune disorder, cancer, allergy, asthma;

The present sequence was used in the construction of chimeric receptors.

The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane-anchoring region for transmembrane or membrane-anchoring regions for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cygen transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes)
                                                                                                                                                                                                    Altering the properties or level of expression of membrane-associate proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 98 BP; 2 A; 37 C; 25 G; 34 T; 0 U; 0 Other;

The invention relates to detecting (M1) alterations in trinucleotide repeat (TMR) tract lengths comprising: (i) contacting mammalian cells with a shuttle vector (containing approximately 25 repeats) that enters and replicates in the cells; (ii) recovering the replicated shuttle vector from the cells; (iii) introducing the vector into a yeast cell in the presence of a selection agent or (where the expanded TMR confers a confers resistance to the selective agent or His+ phenotype; and (iv) confers resistance to the selective agent or His+ phenotype; and (iv) celecting yeast cells with the shuttle vector containing TMR tract contextions that survived the presence of the selective agent. Also included is an adaptation of the used to detect the contraction of 33 or concern to the present invention are useful for identifying disorders with genetic alterations associated with TMR instability such as cancer especial and prostate), Fragile & Syndrome, Huntington's disease, contours and prostate), Fragile & Syndrome, Huntington's disease, contours and Kennedy's disease. expression of membrane-associated to cell surface antigens or the Altering the properties or level of exp proteins, e.g., to change responses to sensitivity of intracellular signaling.

Example 2; Fig 3; 47pp; English

The properties and level of expression of a membrane-associated protein may be altered by substituting a transmembrane region or a membrane anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane-sociated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumator) arthritis, costeoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic psorialasis), neurological disorders (e.g. cygan transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes) construction of chimeric receptors sequence was used in the The present

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (I) at low stringency, preparing cingle-stranded cDNA by reverse transcribing mRNA with (I), amplifying cond amplifying teps with different primers and sequencing resulting cond amplifying steps with different primers and sequencing resulting nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism; and for sequencing nucleotide sequence from a genome of an organism; and for sequencing a nucleic acid molecule from a genome of an organism; and for sequencing all or part of a genome of an organism; and for sequencing all or part of a genome of an organism; and for sequencing all or part of a genome of an organism; and for sequencing all or part of a genome of an organism; and for sequencing colon cancer or breast cancer cell. The method is useful for analyses of oppulations of subjects and can be used to carry out genetic analyses of a system to determine if, e.g. there have been genetic shifts which render an individual or population more or less likely to be afflicted with congenital diseases, and the risk of affliction to a foetus, as well as through ove or sperm. The method can also be used in the study of through ove or sperm. The analyses for pathological conditions can be arried out in all animals, plants, birds, fish, etc. Using this method, and the area of agriculture, for example the genomes of food crops can be arried out in all animals, plants can be arried out in all animals, plants can be arried ont in all animals, plants can be arried ont in all animals, plants can be arried out in all animals, plants are arreaded to effect in the area of agriculture, for example the genomes of food crops can be arried ont in all animals, plants are arreaded to effect on a per more the area of agriculture, for example the genomes of food crops can be arried out in all entered to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1454 AGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGCGGGAGCTGG 1513
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          studied to determine if resistance genes are present, defects in plant genomes can also be studied in this way. Similarly, the method permits determination of the pathogens which integrate into the genome, such as retroviruses and other integrating viruses such as influenza virus, have undergone shifts or mutations, which may require different approaches to therapy. This method is also applied to eukaryotic pathogens, such as trypanosomes, different types of Plasmodium, etc. The method essentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        eliminates sequencing of non-coding portions. This sequence represents a polynucleotide isolated from human colon cancer cell cDNA library
                                                                                                                                                                                                                                     Determining open reading frames of genome of an organism e.g. a human suffering from cancer involves use of single oligonucleotide primer at low stringency for preparing single-stranded cDNA from mRNA of individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

                                                                                                                                                                                                                                                                                                                                                                                Diagnosing spinocerebellar ataxis type II - by PCR and determining number of CAG repeat units.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CA3 repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SCA2 gene; spinocerebellar ataxis type II; CAG repeat; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a fragment of a human CAG repeat containing clone DNA sequence isolated using the method of the invention. The method is far analysing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligonucleotide primer comprising a CTG repeat, a second oligonucleotide primer comprising a CTG repeat and a polymerses and PCR reagents; (b) preparing the nucleic acid with the first and second primers; and (d) amplifying the nucleic acid with the first and second primers; and (d) attributed by the containing the amplified product. The method is used to distinguish between the expression of genes in two or more biological samples, e.g. body fluids, cells, solid tissue or solid and liquid foods. It can be used in medical disquostics, e.g. to differentiate between normal and diseased tissue or to assess the variation within monozydotic twin pairs. The method allows the isolation and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological diseases including Huntington's chorea. The method uses PCR suppression, in which only fragments which contain a target repeat are efficiently amplified. This allows accurate identification of differentially expressed genes in various cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1441 CGGGAGCCCCAGGAGCAGGAGCCCAAGCGGCAGCTGGAGCAGCAGCAGCTGGAGAAG 1500

```
Diagnosing spinocerebellar ataxis type II - by PCR and determining number of CAG repeat units.
                                                                                                                              This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                         Disclosure; Page 13-14; 23pp; Japanese.

```
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR12972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xi10-GG1d (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT 84112, USA

                                                                          ò
                                                                                                                                                                         ð
                                       (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwAPA2 (gel 4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XII.0-Gold (Stratagene) cells and selected for ampicillin resistance."

/clone lib="Wouse 10kb plasmid UUGCLM library"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/Inares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by respected for a polynuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4732114 [gb]AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B

The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWMA2 (gi[4721914] glb] APL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (SM MUS MUSCULUS

```
Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a onos inch orifice at constant velocity. The sheared DNA
10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMO42 [gi|4732114[gb|AR129072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptorebent E. coli X11.0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Б

was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GSS 08-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maize genomic sequences found using engineered RescueMu transposon

RescueMu is a 4.9 bb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zamdb.iastate.edu' and follow the links for
'RescueMu.' Grid G was grown at Stanford in 2000. DNA was
extracted from leaf punches, double digested using BamHi
and BgJII, and ligated to form circular plasmids. DH10B
cells were transformed and then screened on LB plates with
'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and B9111, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 12, Appl
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oligonucleotide array, useful for measuring ortholog gene-expression distribution, comprising number of oligonucleotides derived from ortholog gene of different organism immobilized on support.

Disclosure; Page 16; 56pp; Japanese.

The invention relates to a novel oligonucleotide array comprising a number of oligonucleotides derived from an orthologue gene of a different organism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different organisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the orthologue gene of the organism A and organism B. The sequence match degree of the organism species A and the organism species B is less than 10%. The sequence homology of the genes other than the orthologue gene of

```
temperature of the variant genes other than the orthologue gene of the organism species B is 20 degrees C or more. The oligonuclectide array is useful for measuring expression distribution of the orthologue gene in different organisms. The method is useful for comparing expression change of the orthologue gene with respect to comparing expression change of the orthologue gene with respect to the orthologue gene in different organisms. The oligonuclectide array has the ability to perform a measurement of gene-expression distribution of two or more types of organism simultaneously. The oligonuclectide array improves reliability of measurement. This polynuclectide sequence represents a probe of a rat gene for comparison against a human gene used
the organism species A and the organism species B is the level-of-statistical-significance value, calculated using the homology searching algorithm: basic local alignment search tool (BLAST) and the value is 0.1 or more. The found value or the calculated value of the melting-

Ø New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmentalspecific genes

Example 1; SEQ ID NO 10766; 47pp; English.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several

The present invention describes an RNA (I) used for the interference or

Claim 71; SEQ ID NO 171; 176pp; English.

of a target gene

```
cc oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNAs splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a cc oligonucleotide libraries are useful for detecting mRNAs from a cc piological sample, in expression profilling studies, in qualitatively or caracterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal cranscriptomes. The libraries may also be used as specialised minical transcriptomes. The libraries may also be used as specialised minical prological or pathological state, and so allowing the detection of tissue companient or pathological state, and so allowing the detection of tissue and pathology-specific pathological condition; to detect conduction; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular clisor disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from crats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form all the properties of the print of the print

inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-inucleotide to 5-incleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (I); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed different double-stranded RNAs; (3) an array-based method of assessing a phenotypic effect of a double-stranded RNA on a target gene; (4) validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 cucleotide sequences (see ADC16276 to ADC16586). (I) has cytostatic activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene. They are useful for interfering or inhibiting expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     e.g. cancer

New RNA comprising double stranded RNA and a 3' or 5' overhang having a length of 0-nucleotide to 5-nucleotides on each strand, useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression

```
The present invention describes an RNA (I) used for the interference or inhibition of expression of a target gene, where (I) comprises double stranded RNA of 15-40 nucleotides in length and a 3' or 5' overhang having a length of 0-nucleotides in length and a 3' or 5' overhang. Invention of a mand of 15-40 nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mand of the expression of a target gene in a cell interfering with or inhibiting the expression of a target gene in a cell of the expression of a target gene in a cell or expression of a target gene in a cell or expression of a target gene in a cell or expression of a target gene in a cell or expression of a double-stranded RNA or a target gene; (4) and target gene or condition; (5) selecting an optimised sequence of a double-stranded RNA for and (6) a short double-stranded RNA expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene condition; and expression of a target gene condition; of a target gene. They are useful for treating proliferative diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1187 AGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCAGAAGCAGCTGGAGAAGCAGC 1246

5

of membrane-associated

```
The present sequence was used in the construction of chimeric receptors.

The properties and level of expression of a membrane-associated protein
may be altered by substituting a transmembrane region or a membrane-
anchoring region for transmembrane or membrane-anchoring regions that are
not naturally part of the protein. The relative response of membrane-
associated proteins to cell surface-associated antigen versus antigen in
solution, and the sensitivity of intracellular signaling mediated by
membrane-associated proteins can be altered. They can be important in
treatment of, e.g. HIV infection, bacterial infections, parasitic
infections, inflammatory/autoimmune disorders (e.g. relumatoid arthritis,
osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic
diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic
fibrosis or sickle cell anaemia), dermatological disorders (e.g.
psoriasis), neurological disorders (e.g. multiple sclerosis), organ
transplant rejection, graft-versus-host diseases, or metabolic/idiopathic
diseases (e.g. diabetes)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1186 GAGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCAGCAGCAGCTGGAGGAAGCAG 1245
